MedSign launches Qortex™ to fight COVID-19

Company invents first-ever home TV-based Telehealth System to empower shut-ins during pandemic

NEW YORK — May 8, 2020: MedSign International Corporation, a leading-edge Telehealth company, has launched nationwide Qortex™, the first and only home-TV-based Telehealth solution that helps doctors, nurses, hospitals, and home-care agencies deliver virtual medical services to patients confined to their homes, especially during this COVID-19 pandemic. “With today’s stay-home mandates, Qortex can ease isolation-related fear and anxiety, and offer peace of mind by giving even the most technology-averse seniors real-time, full-screen, face-to-face visits with their medical providers and loved ones, using what they know best... their own TV sets,” said Tom Conroy, MedSign CEO and Qortex’s inventor.

“I originally created Qortex to keep my family healthy, safe and secure, including my 92-year-old Dad who served in World War II,” Conroy said. He added: “Now I realize Qortex’s capabilities can help everyone who is sick at home or recovering from hospitalization, as well as those individuals now affected by the Coronavirus. As a retired U.S Air Force officer, I also know Qortex can support fellow Veterans who are chronically ill, remote, disabled, depressed, or suicidal. We provide them immediate access to virtual care and counseling 24/7, in the comfort of their homes, through their TV screens. With Qortex, they’re never alone.”

The patent-pending, HIPAA compliant Qortex System is easy to install. It includes a communications hub, a high-definition camera, and a simple, custom-designed, senior-friendly remote control. Qortex connects with any Internet service and HDMI television and is compatible with all smartphones and tablets. Qortex’s single, comprehensive platform bolsters all Telehealth needs, among them: scheduling and reminders of drug doses, therapy sessions, and hydration. Qortex also incorporates a suite of health, wellness, and security apps, including an advanced Personal Emergency Response System (PERS), a multiplatform life-caring and emergency response app that delivers critical services to promote and protect lives, anytime and anywhere.

The Qortex system is already used by Home Care agencies in Florida and Southern California, where it has made a tremendous impact improving the health and care of many seniors and disadvantaged citizens. This innovative Telehealth technology soon will be available through hospitals, physician groups, homecare companies, professional healthcare organizations, and government agencies that defend America during this national emergency.
